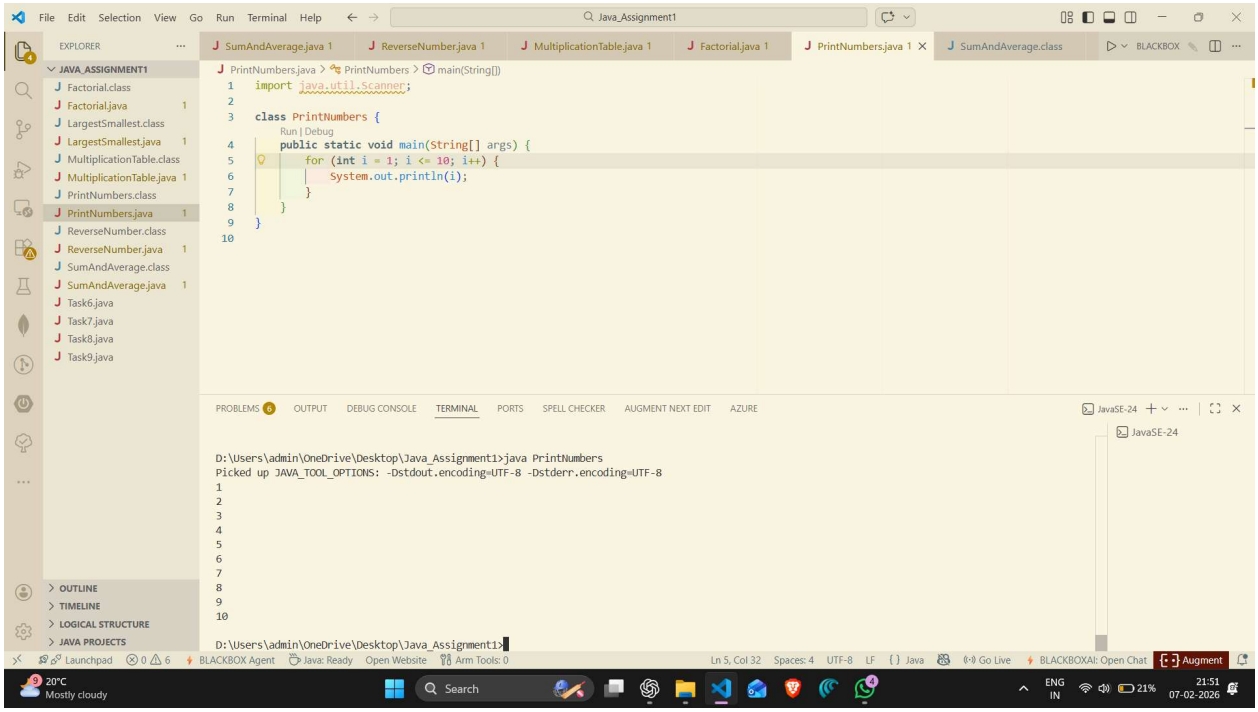
HARSHITH V-1MJ22CS073

MINDSET Java Programming Internship: Assignment-1(FEB-3 TO FEB-4,2026)

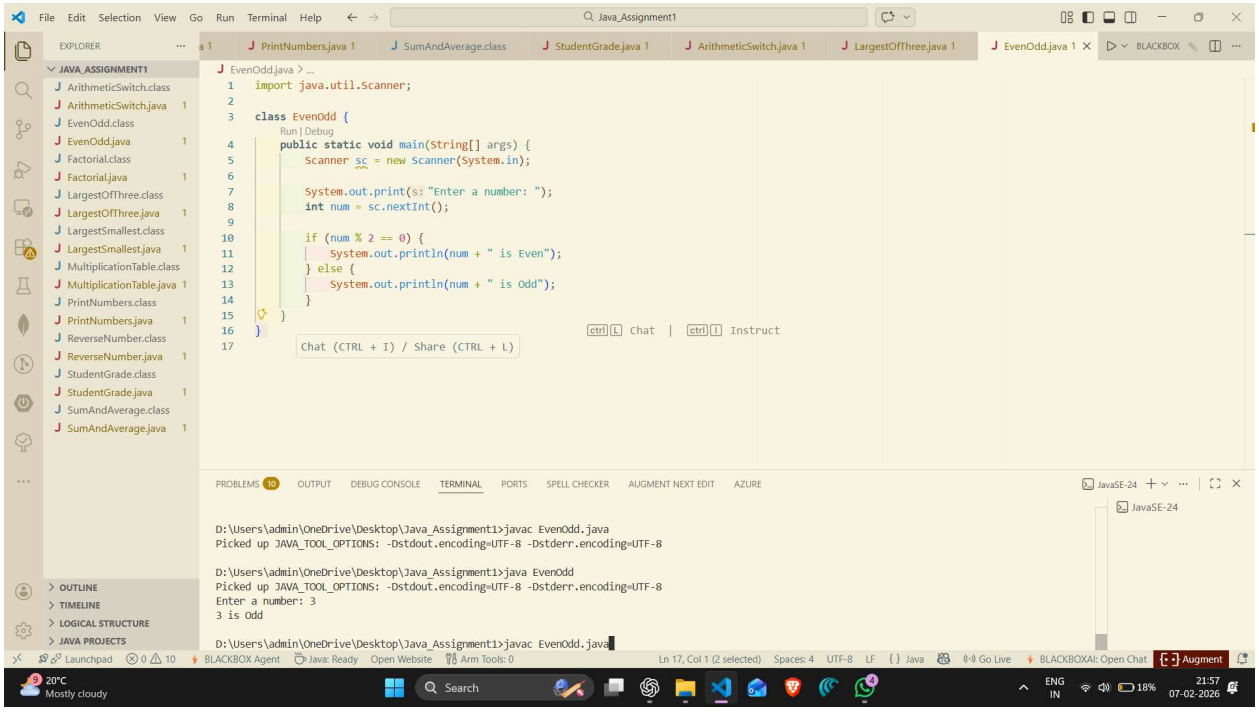
1. Print Numbers (For Loop)

Concept: Demonstrates the use of a simple for loop to iterate a specific number of times and print a sequence of integers to the console.



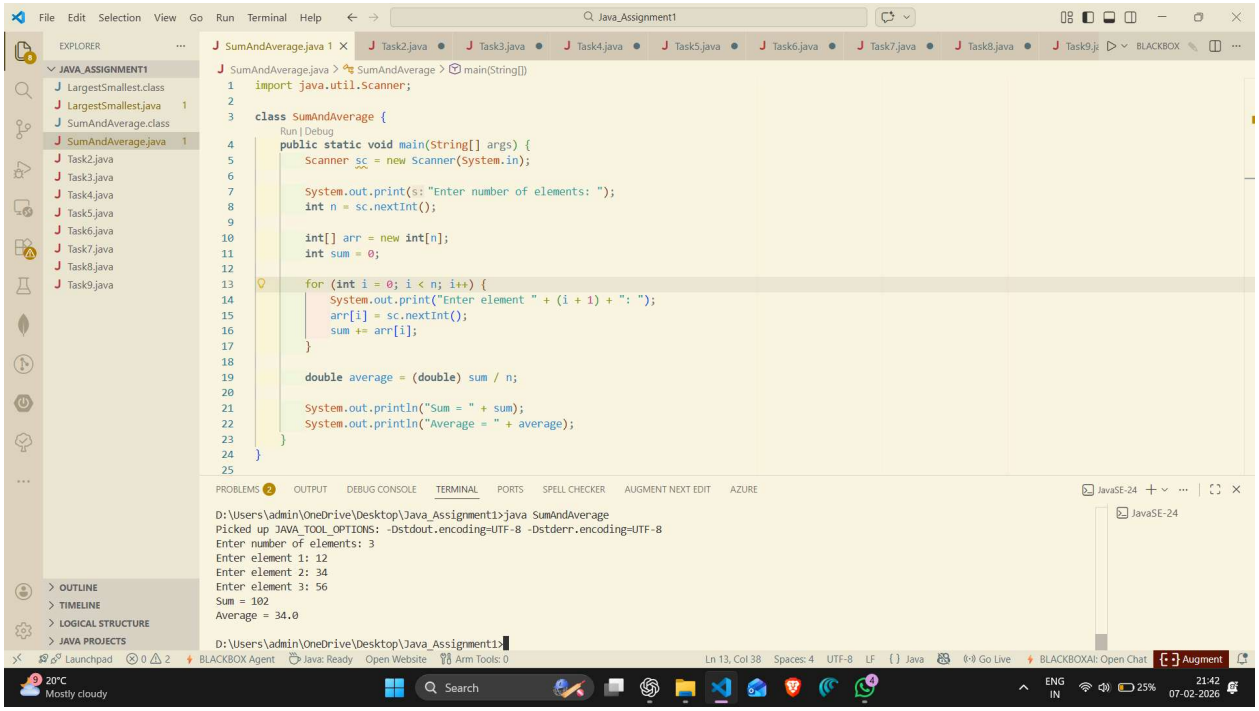
2. Even or Odd Checker

Concept: Illustrates the use of the modulo operator (%) and if-else conditional statements to determine if a user-provided integer is divisible by 2.



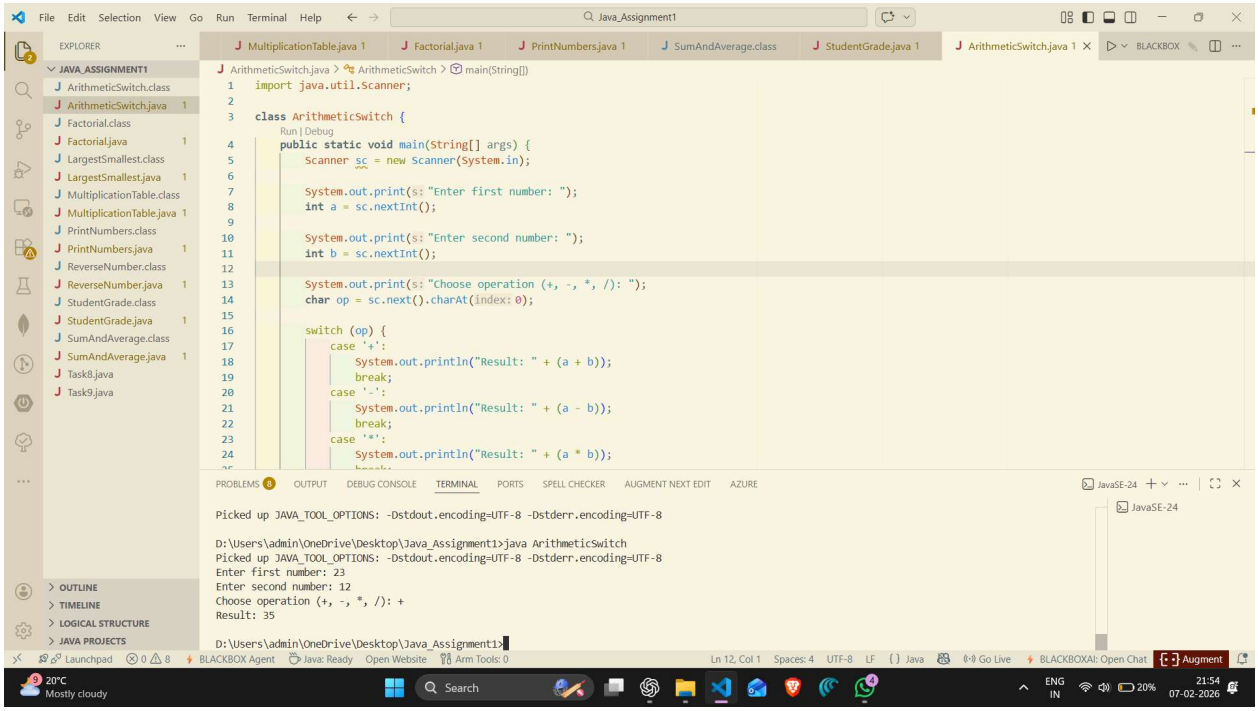
3. Sum and Average of N Numbers

Concept: Combines array handling and user input to calculate the total sum and the mathematical average of a dynamic set of numbers.



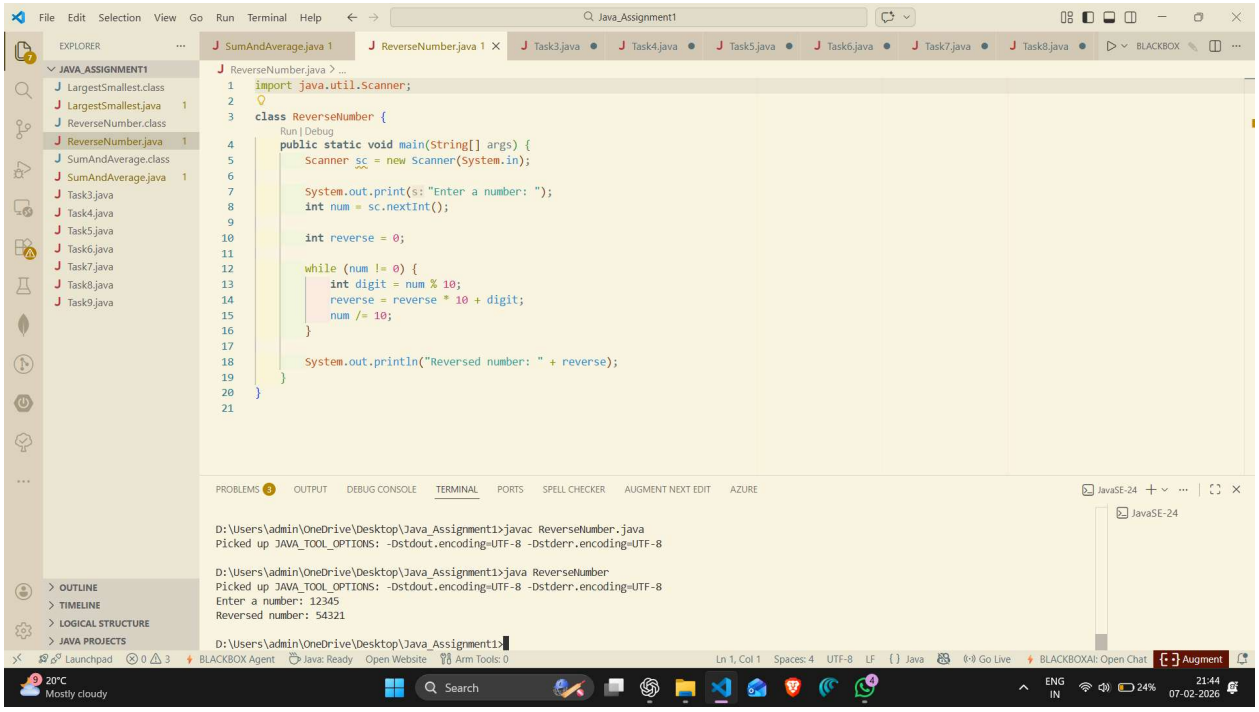
4. Multi-Operation Calculator (Switch Case)

Concept: Uses a switch statement to perform different arithmetic operations based on a character input (+, -, *, /).



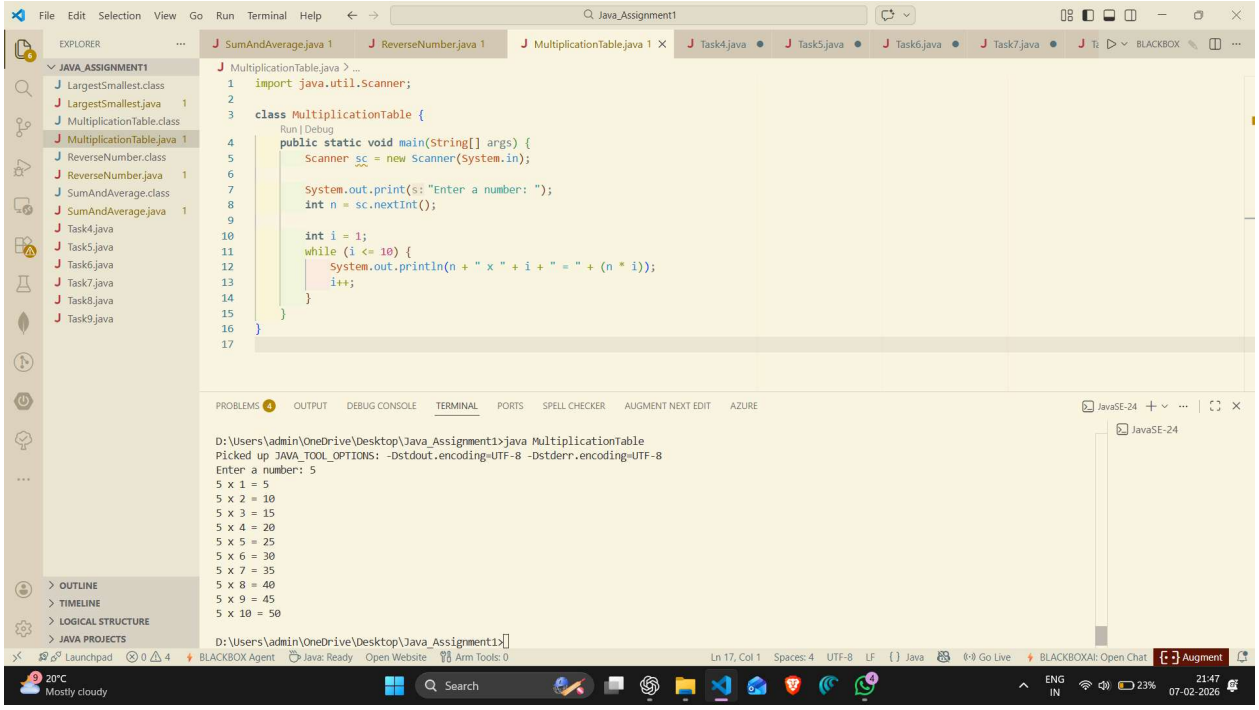
5. Reverse a Number (While Loop)

Concept: Uses a while loop and mathematical operations (remainder and integer division) to reverse the digits of a given number.



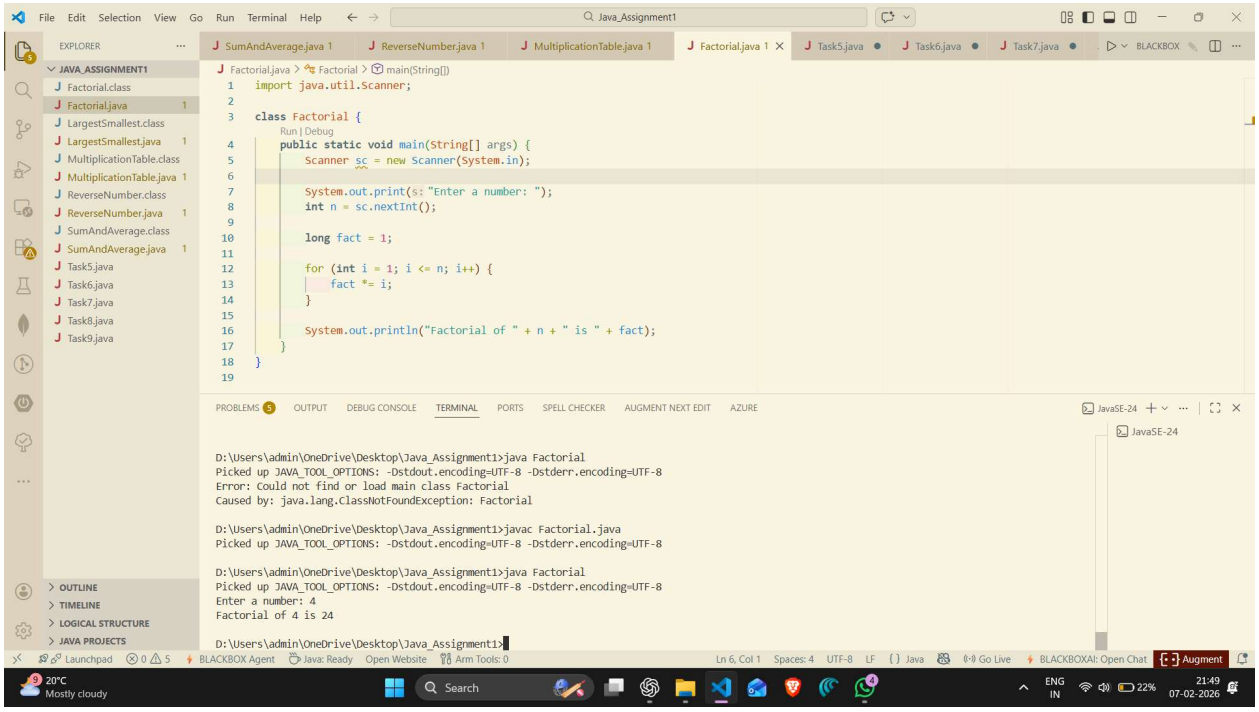
6. Multiplication Table

Concept: Demonstrates how a loop can generate a formatted mathematical table for any given integer.



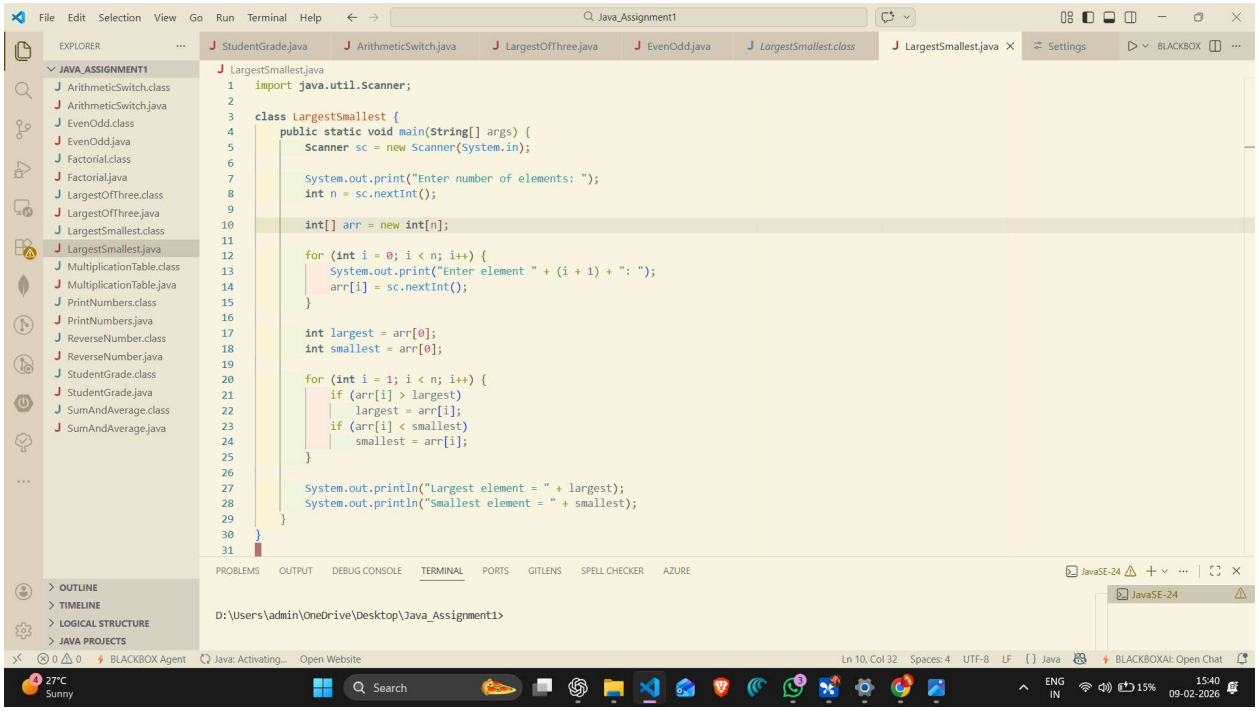
7. Factorial Calculation

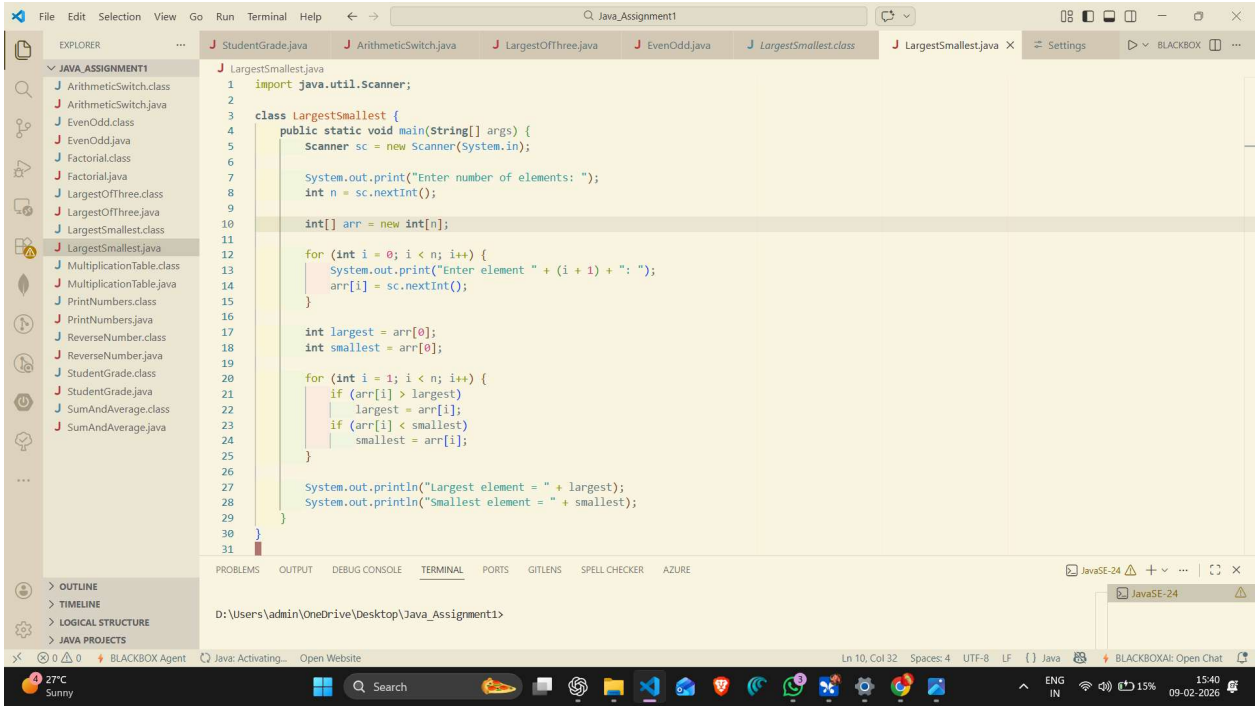
Concept: Calculates the product of all positive integers up to n using a loop, highlighting the use of the long data type for large results.



8. Find Largest and Smallest in Array

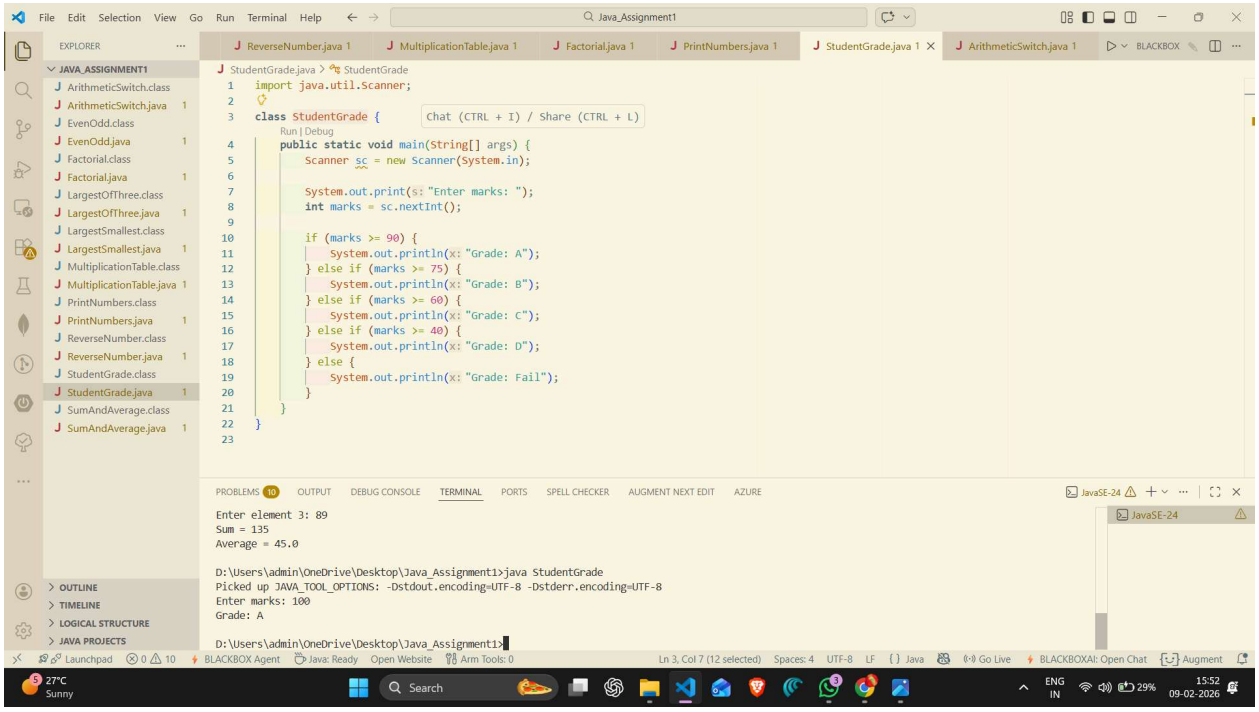
Concept: This program demonstrates how to traverse an array to compare and identify the extreme values (maximum and minimum) from a user-defined set of integers.

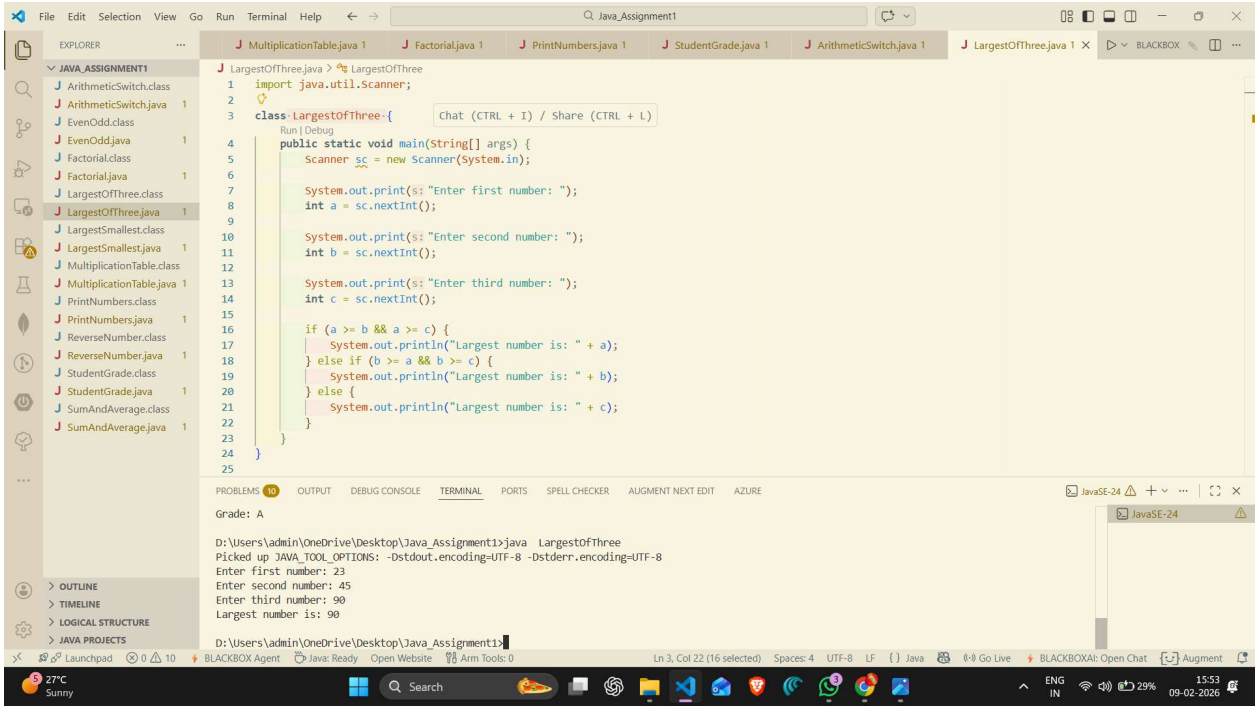




9. Student Grade Checker

Concept: This program uses if-else if-else ladders to evaluate a student's marks and assign a corresponding letter grade based on pre-defined percentage brackets.



10. Largest of Three Numbers


Concept: This program takes three integers as input from the user and uses relational and logical operators (&&) to determine which of the three values is the greatest.
